

Assignment 6A - Prototype Discussion

Expectations

Given my Assignment 5 submission and the details given by this overly ambitious mock-up, I wanted to implement a lot of things including a modal product page, an image carousel in the landing page, and secondary modal boxes that act as confirmation boxes.

abandoned

Replaced with generic
productinfo.html page

Key point:
Work on Local
Storage before
you try that
fancy stuff

Reality

However, I forgot to realize the fact that I didn't get a degree in computer science back in undergrad and that I lack the formal understanding and functionality that someone who's properly trained has. Although W3Schools has a lot of resources, I lack the experience to implement any of that nonsense efficiently.

To give you an idea of what happened, I worked on implementing modal boxes and tabbed navigation for about 4 hours before I realized that I've basically wasted my time implementing something that doesn't work and that I'll probably get my points docked as there's no way I can submit anything worthwhile before midnight.

So, I decided to do the proper programmer move of reaching for low-hanging fruit and working on the basics that I do understand.

First things first, I should do the assignment's bare minimum tasks.
